Previously, in LX522...

- Wh-movement: Interrogative C has [clause-type:Q, uwh*], wh-words have [wh], T has [uclause-type:] (valued as strong when valued by main-clause C with Q, causing subject-aux inversion)

Multiple wh-questions

- It is possible to ask a question with more than one wh-word:
- (What I want to know is:)
  What will Dan give to whom?
- Casey knows who moved where.

\[
\text{[CP what C+will [TP <Dan> <will> [VP <Dan> v+give [VP <what> <give> [PP to whom]]]]}
\]

wh-in-situ

- In English wh-questions, a wh-word moves up to SpecCP. But if there are two, then only one moves, the other stays behind, “in its natural place.”
- Does our system so far predict this?
- In wh-questions, C has a [Q] feature and a [uwh*] feature.
- When the [uclause-type:] feature of T is valued by Q the resulting [uclause-type:Q*] feature on T is strong.
- So, moving one will do. But which one? Either?

*What did who give to Casey?*

- It turns out that when you have two options in principle, only one is actually grammatical:
- Who gave what to Casey?
- *What did who give to Casey?*

\[
\text{[CP who C [TP <who> T [VP <who> v+give [VP what <give> ...]]]]}
\]

\[
\text{[CP who C [TP <who> T [VP <who> v+give [VP what <give> ...]]]}
\]

*What did who give to Casey?*

- Superiority
  The highest wh-word moves.
  (All things being equal, the shorter move is preferred)

- Compare:
  - A book was given <a book> to Pete.
  - *Pete was given a book to <Pete>.
  - [CP who C [TP <who> T [VP <who> v+give [VP what <give> ...]]]

\[
\text{[CP who C [TP <who> T [VP <who> v+give [VP what <give> ...]]]}
\]

\[
\text{[CP who C [TP <who> T [VP <who> v+give [VP what <give> ...]]]}
\]
D-linking

- Just a note: Sometimes you can get away with violating Superiority:

- I have a list of the authors here, and a list of the books. But I don’t know which book which author wrote.

- When this happens, the interpretation is somewhat special. The wh-word that is “skipped” (and generally both of them) is picking out one of a small, known list. D(iscourse)-linking.

The wh-typology

- **English:** One wh-word moves to the front.
  - What did Bill give to whom?
- **Japanese:** No wh-words move to the front.
  - Taroo-ga dare-ni nani-o ageta no?
  - T-nom who-to what-acc gave Q
  - “What did Taroo give to whom?”
- **Bulgarian:** All wh-words move to the front.
  - Kakvo na kogo Ivan dade?
  - what to whom Ivan gave
  - “What did Ivan give to whom?”
- **French:** One wh-word or no wh-words move to the front.
  - Qui as-tu vu? Tu as vu qui?
  - Who have you seen You have seen who
  - “Who did you see?”

wh-in-situ languages

- How might we account for the difference between English and Japanese (Korean, Turkish, Chinese, …) with respect to moving wh-words?

- Why does one wh-word move in English?

- We account for the difference between **French** (v moves to T) and **English** (v does not move to T) in terms of whether the [uInflect] feature on v is strong (French) or weak (English) when valued by T.

Kakvo na kogo Ivan dade?

- How about languages like Bulgarian, where all of the wh-words move?

- [CP kakvo na kogo [TP Ivan dade <kakvo> <na kogo>]]

- This one is somewhat trickier… but interesting.

- Why do wh-words have to move (in general)?

- Why is it sufficient to move just one (in English)?

- What might we propose in order to ensure that any wh-word has to move?

Multiple wh-movement

- To account for this stretches our system in several ways, but ultimately we want to be able to say that Bulgarian and English differ minimally, so we'll need to account for Bulgarian too.

- Suppose that wh-words in Bulgarian have the strong feature: [uQ*].

Kakvo na kogo Ivan dade?

- For this to work, we need to suppose that it is possible for a strong feature like [uQ*] on a wh-word to “wait” if there is no way to be checked yet.

- That is, we can proceed on to VP (by HoP), despite the fact that there are strong features left inside VP (but not on VP).
Kakvo na kogo Ivan dade?

- Otherwise, things proceed just as in English...

When we get to C, the wh-words finally have a way to be checked.

We've got two choices.

- Na kogo has been waiting longer.
- Moving kakvo would result in a shorter move.

Given what we see in Bulgarian, it seems that “seniority” is more important than “making the shortest move.”

Recall that the Superiority effect in English comes from a need to “make the shortest move,” but in English, there's no consideration of “seniority.”

Cross-linguistic variation

- By now, we've accumulated a (relatively small, all things considered) set of parameters on which languages can vary, in terms of whether uninterpretable features are strong or weak.

  - **Tense on Aux:**
    - **Strong** (aux moves to T): English, French, German, Irish
    - **Weak** (aux doesn't move to T): Swedish
  
  - **Tense on v:**
    - **Strong** (v moves to T): French, German, Irish
    - **Weak** (v doesn't move to T): English, Swedish
  
  - **EPP on T:**
    - **Strong** (subject moves to SpecTP): E, F, S, G
    - **Weak**: Irish
Cross-linguistic variation

- To this we can add the parameters of wh-movement...

- \([\text{wh}] \text{ on } [\text{Q}]\)-type C:
  - Strong (A wh-word moves to SpecCP): English, German, ...
  - Weak (No wh-word need move to SpecCP): Japanese, ...
  - Optional (either is possible): French

- \([\text{Q}] \text{ on } \text{wh-words}:
  - Strong (All wh-words move to SpecCP): Bulgarian, ...
  - Weak (Wh-words need not move to SpecCP): English, ...

Reminder: Embedded clauses

- Some verbs take DP objects:
  - Hurley grabbed \([\text{DP the notepad}]\).
  - Hurley wrote \([\text{DP a note}]\).

- Some verbs take entire clauses (CPs, TPs):
  - Hurley said \([\text{CP that he was taking a census}]\).
  - Hurley seemed \([\text{TP } <H> \text{ to enjoy the task}]\).
  - Hurley asked \([\text{CP where Ethan lived}]\).

- It is perfectly possible to ask a question requesting information about something in an embedded clause. A "long-distance question".
  - What did Hurley say \([\text{CP that he was taking <what>}]\)?

Long-distance wh-movement

- What did Hurley say \([\text{CP he was writing <what>}]\)?

- This is a question: The highest C has a \([\text{Q}] (=\text{clause-type:Q})\) feature and a \([\text{uwh}^\text{Q}}\) feature.

- When C values the \([\text{uclause-type:}]\) feature of T, it becomes \([\text{uclause-type:Q}^\text{Q}}\). To check this feature, T moves to C.

- When T is adjoined to C, its sister is not headed by v, so we "insert do" to pronounce the tense.

- To check the \([\text{uwh}^\text{Q}}\) feature of C, the interrogative pronoun what moves up (into SpecCP).

\[
\begin{array}{c}
\text{[CP what \text{T+C > say [CP he was writing <what>]]}} \\
\text{[wh \text{[uQ,Q]}}+[\text{[Q, uwh}]
\end{array}
\]

Long distance wh-movement

- At first glance, there seems to be no limit on how far a wh-word can move any more than there is a limit on how many clauses you can embed:
  - What did Jack bring?
  - What did Charlie hear \([\text{CP Jack brought _}]\)?
  - What did Claire say \([\text{CP Charlie heard [CP Jack brought _]}]!\)
  - What did Kate think \([\text{CP Claire said [CP Charlie heard [CP Jack brought _]}]]\)?
  - And yet…

Islands

- Hurley claimed \([\text{CP that the list does not include Ethan }]\).

- Who did Hurley claim \([\text{CP that the list does not include _}]\)?

  - Jack believes \([\text{DP the claim [CP that the list does not include Ethan }]\).

- *Who does Jack believe \([\text{DP the claim [CP that the list does not include _]}}\)?

  - Who starts out inside the DP.
  - The DP forms a sort of barrier to movement.

  - Complex Noun Phrase island
Locality

- **The generalization** (which we hope to explain): A *wh*-word cannot move out of a DP.
- This is a **locality condition**, a requirement that *wh*-movement not go too far (where escaping from inside a DP counts as “too far”).
- We have a bit of a paradox, then: *Wh*-words seem to be able to move arbitrarily far (e.g., from any number of embedded clauses)—but *wh*-words cannot move too far (e.g., out of a DP).

Can *wh*-words go arbitrarily far?

- Assuming that moving a *wh*-word out from inside a DP is impossible because it is moving the *wh*-word “too far”, we should go back to look at why we thought *wh*-words could move arbitrarily far.
- What did Kate think [CP Claire said [CP Charlie heard [CP Jack brought _ ]]]?
- Where do *wh*-words generally move?
- What will Ethan do _?

What exactly is going on?

- What exactly did you buy?
- What did you buy exactly?
  - All the students will buy a textbook.
  - The students will all buy a textbook.
- What exactly did he say [CP that he wants]?
- What did he say [CP that he wants exactly]?
- What did he say [CP exactly that he wants]?

Scottish Gaelic complementizer agreement

- Bha mi ag ràdh **gun** do bhual **i** e. was I **ASP** saying **that** PRT struck she him ‘I was saying that she hit him.’
- Tha mi a’ smaoineachadh **gu** bheil lain air a mhisg. am I **ASP** thinking **that** is lain on his drink ‘I think that lain is drunk.’
- Cò bha thu ag ràdh a bhuail **i**? who were you **ASP** saying **that** struck she ‘Who were you saying that she hit?’
- Cò tha thu a’ smaoineachadh a tha air a mhisg? who are you **ASP** thinking **that** is on his drink ‘Who do you think is drunk?’

Inversion in Spanish

- Maria contestó la pregunta. Maria answered the question ‘Maria answered the question.’
- Contestó la pregunta Maria. answered the question Maria ‘Maria answered the question.’
- ¿Qué querían esos dos? what wanted those two ‘What did those two want?’
- “¿Qué esos dos querían? what those two wanted” ‘What did those two want?’

Successive inversion

- Juan pensaba que Pedro le **había dicho que**… Juan thought that Pedro to-him had said that la revista **había publicado** ya el artículo. ‘Juan thought that Pedro had told him that the journal had published the article already.’
- ¿Qué pensaba Juan que le **había dicho Pedro**… what thought Juan that to-him had said Pedro que **había publicado la revista**? ‘What did Juan think that Pedro had told him that the journal had published?’
Successive inversion

• Juan pensaba que Pedro le había dicho que…
  Juan thought that Pedro to-him had said that the journal had published the article already.

• Qué pensaba Juan que le había dicho Pedro…
  What did Juan think that Pedro had told him that the journal had published?

When a wh-word is in SpecCP, the subject must appear after the VP.

That “unbounded” movement…

• It looks like (where we can tell), a wh-word that moves from inside an embedded clause actually moves first to the SpecCP of the embedded clause, and then moves on.

  [CP <what> that Pat would eat <what> ] ]

• Compare:
  [CP [TP Pat seems [TP <Pat> to be likely [TP <Pat> to cry ] ] ]] ]

That “unbounded” movement…

• This means: Where it looked like wh-words were moving over great distances, those distances were traversed in small steps.

  What did Kate think [CP <what> Claire said [CP <what> Charlie heard [CP <what> Jack brought <what> ] ] ]?

• If wh-movement is in fact constrained not to move “too far”, this explains how it can look like wh-movement is unbounded.

What it means to move too far

• Having gotten an idea about what is happening, let’s go back to our theory to figure out how we can ensure that it does.

• We need to allow a wh-word to move from one SpecCP to a higher SpecCP.
  [CP What did Al say [CP <what> that Bart stole <what> ] ]?

• We need to prevent a wh-word from moving from further inside a CP to a higher SpecCP.
  [CP What did Al say [CP that Bart stole <what> ] ]?

• A common idea about this is to say that sentences are built up in “chunks”, called phases.

• A CP constitutes a phase.
• Once you’ve built a phase, you can’t “see into it” further than the specifier.
  [CP C[uwh*] [TP AlT say [CP that [TP Bart stole what…

  [CP C[uwh*] [TP AlT say [CP what that [TP Bart stole <what>…

  So, in order for [uwh*] to be checked, what must be visible to it.

What it means to move too far

• To allow what to move to an embedded SpecCP, we need to be able to add (optionally) a [uwh*] feature even to a C that is not itself [clause-type:Q].

  [CP C[uwh*] [TP AlT say [CP what that [TP Bart stole <what>…

• If you don’t, the topmost [uwh*] can never be checked.

• Embedded C may optionally bear [uwh*].
**Wh-islands**

- Having gotten this far, we predict that it is not possible to turn this
  Pat asked [\texttt{CP} who kidnapped the Lindbergh baby].
  into a question asking about the kidnappee:
  "Who did Pat ask [\texttt{CP} who kidnapped <who>]?"

- See why?

**Wh-islands**

- An embedded question forms another kind of an "island", generally called a \textit{wh-island}.

- The embedded C already had a \texttt{[uwh*]} feature, which was checked by moving the first wh-word into SpecCP. By the time we get to the main clause C, it can no longer see a wh-word inside the embedded clause.

- "Who did Pat ask [\texttt{CP} who kidnapped <who>]?"

**Op**

- In fact, remember when we looked at yes-no questions and suggested that even they have a "silent whether" (\texttt{Op})

- Pat wondered [\texttt{CP Op} if Hauptmann kidnapped the Lindbergh baby].
  "Who did Pat wonder [\texttt{CP Op} if Hauptmann kidnapped <who>]?"

- Evidence that \texttt{Op} is really there.

**Complex Noun Phrase islands**

- We can use the same kind of explanation for the Complex Noun Phrase islands:

- "Who does Jack believe [\texttt{DP} the claim [\texttt{CP} that the list does not include _ ]]?!"

- If we suppose that DP, like CP, is a phase.

- "Who does Jack believe [\texttt{DP} the claim [\texttt{CP} that the list does not include _ ]]?!"

**Adjunct islands**

- One last type of island we'll consider is the \textbf{adjunct island}. Generally: A wh-word cannot escape an adjoined modifier.

- Dr. Hibbert laughed [\texttt{CP} when Homer lost a finger].
  "What did Dr. Hibbert laugh [\texttt{CP} when Homer lost]?"

- We don't yet have a good explanation for this. So far, we predict these should be possible.

**Adjunct islands**

- To account for the islandhood of adjuncts in our system, we will add one further condition:

- \textbf{The specifier of a phase is only visible to feature matching if the phase gets a 0-role.}

- Note: Adger makes this one step more complicated, to account for "subject islands" but we won't do that here.

- Adjuncts differ from arguments in precisely this property.
In sum...

- Sentences are “chunked” into **phases** as they are built up. Phases are **CP** and **DP**.

- A feature outside of a phase cannot match a feature further inside the phase than its specifier.

- This leads to **island phenomena**, configurations in which a wh-word would be “trapped”:
  - **CNP islands**: A wh-word cannot get to the specifier of DP and so is not visible from outside.
  - **Wh-islands**: A wh-word cannot get to the specifier of an embedded question (that already has a wh-word, or Op, in its specifier).
  - **Adjunct islands**: Even the specifier is not visible if the phase did not get a θ-role.
