Constituency tests

Replacement test
- Fragment test
- Ellipsis
- Clefing
- Movement test

Replacement test

1. The students left.
2. They left.
   - They is a constituent.
3. The students will eat the sandwiches.
4. They will eat the sandwiches.
5. The students will eat them.
6. The students will dine.
   - [The students] will [eat [the sandwiches]].

Sentence fragment test
Generally, only constituents can be used in the fragmentary response to a question.
- Who will eat the sandwiches?
  - The students.  *Students will eat the.
- What will the students do?
  - Eat the sandwiches.  *Eat the.
- What will the students eat?
  - The sandwiches.
  - [The students] will [eat [the sandwiches]].

Ellipsis test
If you can elide a string, it qualifies as a constituent.
- Ellipsis is really deletion of a string from a sentence. Sometimes this is “repaid” by using the verb do, something which we will seek to explain at a later point.

The professors will eat the sandwiches, and then...
- The students will.
  - The students will eat the cookies, and then...
  - The professors will sandwiches.

WARNING: Passing a constituency test constitutes evidence for a constituent. Failing a constituency test tells you little—there may be other reasons for the ungrammaticality.
**Movement (topicalization) test**

Sometimes you can "move" a string of words to the front of a sentence (then generally interpreted as the topic of the sentence). When you can, you’ve found a constituent.

- The sandwiches, the students will eat _.
- Eat the sandwiches, the students will _.
- The students, they will eat the sandwiches.
- *Students will, the eat the sandwiches.
- *Students, the will eat the sandwiches
  - Failing a constituency test isn't evidence against constituency!

**Clefting test**

Like the movement test, if you can fit your string into the frame it be X that S (where you move the string X from inside S), X is a constituent.

- It's the sandwiches that the students will eat _.
- It's the students that _ will eat the sandwiches.
- It's eat the sandwiches that the students will (do) _.
- *It's students eat that the _ will the sandwiches.
- *It's eat the that the students will _ sandwiches.

**Trees, hierarchy, and constituency**

- [The students] [ate [the sandwiches]]

```
the students ate the sandwiches
```

- The triangle

Sometimes, when the internal constituency is unknown or unimportant to the current discussion, a triangle is used instead.

```
the students ate the sandwiches
```
Trees

- Root node
- Nodes (with node labels)
- Branches
- Terminal nodes
- Nonterminal nodes

Tree relations

A node $X$ dominates nodes below it on the tree; these are the nodes which would be pulled along if you grabbed the node $X$ and pulled it off of the page. Acts as a unit. Is a constituent.

Tree relations

A node $X$ immediately dominates a node $Y$ iff $X$ dominates $Y$ and is connected by only one branch. Or, $X$ is mother of $Y$. Nodes $X$ and $Y$ that share the same mother are sister nodes.

Verbs and substitution

One of the ways we know a verb is a verb (category) is by observing that it can substitute for other verbs.

- Pat likes to sing. Pat likes to drive.
- Pat bought a book. *Pat bought (a) sing.
- Pat likes to eat sandwiches.
- *Pat unpleasant to eat sandwiches.

So is eat sandwiches a verb?
Well, kind of, yes.
It’s a constituent, a phrase, that has the properties a verb does. A verb phrase.

The making of a phrase

We're trying to characterize our knowledge of syntactic structure.

Our grammatical knowledge is a system (we can judge new sentences).

All things being equal, a theory in which the system is simpler (needed fewer assumptions) is to be preferred over a theory that entails more complex one.

The making of a phrase

In that spirit, we know that a phrase differs from a word in that it contains words (or other phrases).

- We’ve seen that when words are combined into a phrase, the phrase inherits the properties of one of the things we combined. (The phrase has a head).
- Suppose: a phrase can arise from merging two words together, with one taking priority. In a way, attaching one word to another.
The making of a phrase

What will Pat do?
- sing
- eat sandwiches

What does Pat like?
- to eat sandwiches
- to sing
  - [to [eat sandwiches]]

So, a phrase can also arise from combining to and a verb phrase, to make a bigger phrase.

Merge

So, let's go for the simplest theory of structure we can (and only move away from it if the simplest theory won't work)

A phrase is a syntactic object formed by combining (merging) two syntactic objects, with the properties inherited from one of them (the head of the phrase).

A word is a syntactic object.

Merge, in the abstract

A good way to think about this is that we have a number of syntactic objects lying around on a workbench of sorts.

We use the operation Merge to assemble them together into one syntactic object.

Merge, in the abstract

We combine D and E using Merge to form a combined syntactic object.

We need to call our new object something, so we call it C.

C is now a syntactic object (containing D & E).

D and E are now “off the table”—we can’t Merge D with anything because it’s inside C. (“Merge only combines objects at their root nodes”).

Merge, in the abstract

Since C is now a syntactic object, we can combine C with the other syntactic object, B, to form a new syntactic object we’ll call A.

Now, all we’re left with is the single syntactic object A.

Merge, in the abstract

When two objects are Merged, one of them is the head, the most important one.

The head determines the properties of the constituent—that is, the features of the head project to become the features of the whole combined object.
Trees and constituency

- Pat will eat lunch.
- Pat will dine.

eat [V] lunch [N]

Trees and constituency

- Pat will eat lunch.
- Pat will dine.

? eat [V] lunch [N]

Trees and constituency

- Pat will eat lunch.
- Pat will dine.

eat [V] lunch [N]

So how do we know which is the head?

When we Merge two things, one is the head, and determines the properties of the resulting syntactic object.

The next thing we'll turn to is the question of how the syntactic system knows which is the head.

This is a proposition

Let's try to ground this a bit more now, to make it clearer what problems we're solving here.

A primary—and perhaps the most important—type of sentence is that which represents a proposition.

A proposition is the kind of thing that can be true or false (basically).

Truth and Verbs

Michael swam.

*Michael* refers to an individual; it is a name, a label. It is complete.

*Swam* describes an action that can be undertaken by someone, or a property that someone can have. Someone. *Swam* can't be true—it needs an individual, then it can be true (or false).
Predicates and arguments

Suppose the construction of a proposition to be the end result of a (common kind of) sentence construction.

1) Michael swam

Swam needs an individual to be true or false. Fortunately, Michael is an individual. So, combining swam (predicate) and Michael (argument) gives us a proposition, that can be true or false.

Verbs and participants

- **Intransitive (1-place):**
  - Sleep
    - Bill slept.
    - *Bill slept the book.

- **Transitive (2-place):**
  - Hit
    - *Bill hit.
    - Bill hit the pillow.

- **Ditransitive (3-place):**
  - Put
    - *Bill put.
    - *Bill put the book.
    - Bill put the book on the table.

- **Weather (0-place):**
  - Rain
    - It rained.

Verbs and arguments

The “participants” in an event denoted by the verb are the arguments of that verb.

Some verbs require one argument, some require two arguments, some require three arguments, some require none.

Intuitively, the number of arguments is the number of things that a verb needs in order to make a proposition (something that can be either true or false).

Predicates

We will call verbs the predicates. They define properties of and/or relations between the arguments.

1) Bill hit the ball
   - There was a hitting, Bill did the hitting, the ball was affected by the hitting.
   - Different arguments have different roles in the event. (e.g., The hitter, the hittee)

Thematic relations

The thematic relation that the argument has to the verb—the role it plays in the event—will prove useful in describing the behaviors of different classes of verb.

One thematic relation is agent of an action, like Bill in:

1) Bill kicked the ball.

Common thematic relations

Agent: initiator or doer in the event
Theme/Patient: affected by the event, or undergoes the action

1) Sue kicked the ball.

Experiencer: feel or perceive the event

2) Pat likes pizza.

Proposition: a statement, can be true/false.

3) Bill said that he likes pizza.
